

I think these videos are useful for those who are not very good at physics like me. After videos you can see a picture in your mind. Can understand the visual difference between electric motor and electric generator. Also can imagine how DC generator, alternator and induction motors work. It was cool that there was a visual example with a flashlight. It was interesting to learn about magnetism, in fact the most prevalent role of magnetism in our lives is in the generation of electricity. Also the fact that it is used in medicine and transport. These videos were helpful for general understanding of the text.
